Homework 4 Write-Up

Problem 1

The first requirement for the critical section is mutual exclusion, meaning that while one thread is in the critical section, no other thread can be. The second requirement is progress, stating that a thread in the critical section will eventually leave; this prevents threads blocking each other from entering the critical section. The third requirement states that there is bounded waiting, meaning that if a thread is waiting to enter the critical section, eventually it will. The fourth requirement is time efficiency, where the overhead of entering and exiting the critical section is small.

Problem 2

A terminal window titled 'kippc@odin:~/143a/hw/hw4' with standard window controls. The terminal shows the following commands and output:

```
kippc@odin 01:16:55 ~/143a/hw/hw4
$ make -f Makefile pthread_compute
gcc -o pthread_compute pthread_compute.c -I. -lpthread
kippc@odin 01:17:03 ~/143a/hw/hw4
$ pthread_compute < integers2.dat
max: 999
min: 0
average: 508
kippc@odin 01:17:11 ~/143a/hw/hw4
$ python test_compute.py
gcc -o pthread_compute pthread_compute.c -I. -lpthread
Your output should parse okay!
kippc@odin 01:17:20 ~/143a/hw/hw4
$
```

Problem 3

```
kippc@odin:~/143a/hw/hw4
$ make -f Makefile_mutex_compute
gcc -o mutex_compute mutex_compute.c -I. -lpthread
kippc@odin 01:18:24 ~/143a/hw/hw4
$ mutex_compute < integers2.dat
max: 999
min: 0
average: 508
kippc@odin 01:18:35 ~/143a/hw/hw4
$ python test_compute.py
gcc -o mutex_compute mutex_compute.c -I. -lpthread
Your output should parse okay!
kippc@odin 01:18:46 ~/143a/hw/hw4
$
```
